INTRODUCTION

Rapidly changing patterns of international cooperation and collaboration and revolutionary technological and managerial changes are combining to influence and transform the communication of technical information in the workplace. To contribute to our understanding of workplace culture, organization, and communications at the national and international levels, an exploratory study was conducted that investigated the technical communications practices of aerospace engineers and scientists in Japan and in the United States (U.S.). Previous work includes exploratory studies of the technical communications practices of aerospace engineers and scientists in Israel [1], selected Western European countries [2], Russia [3], and the Netherlands [4].

The data reported herein were collected through self-administered (self-reported) questionnaires undertaken as a Phase 4 activity of the NASA/DoD Aerospace Knowledge Diffusion Research Project. The Japanese/U.S. study included the following objectives:

- 1. To solicit the opinions of aerospace engineers and scientists regarding the importance of technical communications to their profession,
- 2. To determine the use and production of technical communications by aerospace engineers and scientists,
- 3. To seek their views about the appropriate content of an undergraduate course in technical communications,
- 4. To determine their use of libraries and technical information centers,
- 5. To determine their use and the importance of computer and information technology to them,
- 6. To determine their use of electronic networks, and
- 7. To determine their language (ability to read and speak) skills and their use of foreign and domestically produced technical reports.

DTIC QUALITY

BACKGROUND

Aerospace engineering exhibits particular characteristics which make it an excellent platform for studying technical communications in the international workplace. The aerospace industry is becoming more international in scope and increasingly collaborative in nature, thus creating a multinational manufacturing environment. International industrial alliances will result in a more rapid diffusion of technology in order to enhance innovation and increase productivity. Aerospace producers will feel growing pressure to push forward with new technological developments, to maximize the inclusion of those developments into the research and development (R&D) process, and to maintain and improve the professional competency of aerospace engineers and scientists. Meeting these objectives at a reasonable cost depends on a variety of factors, but largely on the ability of aerospace engineers and scientists to acquire, process, and communicate scientific and technical information (STI). Although studies indicate that access to STI can increase productivity and innovation and help engineers and scientists maintain and improve their professional skills, these same studies demonstrate that little is known about how aerospace engineers and scientists find and use STI or how aerospace knowledge is diffused. To learn more about this process, researchers at the NASA Langley Research Center, the Indiana University Center for Survey Research, Rensselaer Polytechnic Institute, and institutions in selected countries are studying aerospace knowledge diffusion. These studies comprise the NASA/DoD Aerospace Knowledge Diffusion Research Project. The project fact sheet is Appendix A.

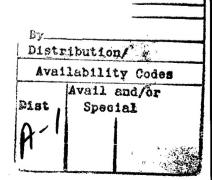

Phase 1 of the project investigates the information-seeking behavior of U.S. aerospace engineers and scientists and places particular emphasis on their use of federally funded aerospace

R&D and U.S. government technical reports. Phase 2 examines the industry-government interface and emphasizes the role of information intermediaries in the aerospace knowledge diffusion process. Phase 3 concerns the academic-government interface and focuses on the relationships between and among the information intermediary, faculty, and students. Phase 4 explores patterns of technical communications among non-U.S. aerospace engineers and scientists in selected countries [5].

RESEARCH DESIGN AND METHODOLOGY

Data were collected through self-administered (self-reported) questionnaires. The instrument used to collect the data had been used previously in several Western European countries and in the Netherlands and Russia in slightly adapted form. The Japanese-language version of the instrument is Appendix B. English-language questionnaires were distributed to 558 aerospace engineers and scientists at the NASA Ames and NASA Langley Research Centers in the U.S., and 340 were received by the established cut-off date for a completion rate of 61%. A follow-up survey containing additional questions about technical communications training, technical report use, and language skills was distributed to the U.S. respondents. Two hundred eighty-seven of the 340 U.S. respondents completed and returned the survey for an adjusted rate of 48%. The U.S. survey was conducted during July and August of 1992 with a follow-up in December 1992.

Japanese-language questionnaires were sent to 13 Japanese aerospace engineers and scientists. We sent multiple questionnaires to each member of the sample and asked that each recipient distribute the survey to colleagues. We received 94 of the 110 surveys by the established cut-off date. The Japanese survey was conducted during March and June of 1994.

0

PRESENTATION OF THE DATA

This report presents selected results from the Japanese and U.S. studies, with the Japanese responses presented first, followed by the U.S. responses. Demographic data are presented first, followed by data dealing with language proficiency, the importance of technical communications, workplace use and production of technical communications, appropriate course content for an undergraduate course in technical communications, use of libraries and technical information centers, use of computer and information technology, use of electronic networks, and use of foreign and domestically produced technical reports.

Demographic Information About the Survey Respondents

Survey respondents were asked to provide information regarding their professional duties, years of professional work experience, educational preparation, current professional duties, and gender. These demographic findings appear in table 1. A comparison of the two groups reveals more differences than similarities. The two groups differ significantly in terms of organizational affiliation, gender, and current professional duties; they are similar in years of professional work experience, academic preparation, and professional society membership.

The following "composite" participant profiles were based on the demographic data. The Japanese survey participant works as a researcher (33%), has a master's degree (45%), was trained as an engineer (95%) and currently works as an engineer (100%), has as an average of 15 years professional work experience, and is a member of a professional/technical society (89%). The U.S. survey participant works as a researcher (82%), has a master's degree (46%), was trained as an engineer (80%), currently works as an engineer (69%), has an average of 17 years of professional work experience, and belongs to a professional/technical society (78%).

Survey respondents were also asked to provide information about their foreign language skills, specifically their reading and speaking competencies in the languages used by major international aerospace producers. These findings appear in table 2. The Japanese respondents read and speak English. Both Japanese and U.S. respondents reported limited fluency in foreign languages. The mean (\overline{X}) ability to read and speak French and German was the same for both groups. The mean (\overline{X}) ability to read Russian, although low for both groups, was higher for the U.S. group, while the mean (\overline{X}) ability to speak Russian was slightly higher for the Japanese group.

Table 2. Foreign Language Fluency Among Japanese and U.S. Aerospace Engineers and Scientists

| | | racion | Difficors and | | | |
|--|---|--|--|----------------------------|--------------------------|--|
| | | Japan n = 94 | | | U.S. n = 340 | |
| Language | Read % | Speak % | X̄ Ability ^a | Read % | Speak % | X̄ Ability ^a |
| English French German Japanese Russian | 100 30 71 100 ^b 18 | 99 22 40 100 ^b 10 | 3.8 3.0 1.7 1.6 1.7 1.6 1.3 1.6 | 100 ^b 32 21 3 6 | 100 ^b 22 15 5 | 1.7 1.6 1.7 1.6 1.7 1.7 1.6 1.5 |

^a A 1 to 5 scale was used to measure ability with "1" being passably and "5" being fluently; hence, the higher the average (mean) the greater the ability of survey respondents to speak/read the language.

Importance of and Time Spent on Technical Communications

Approximately 94.7% of the Japanese respondents and 90.6% of the U.S. respondents indicated that the ability to communicate technical information effectively is important. (Importance was measured on a 5-point scale with 1 = very unimportant and 5 = very important;

^b This is the native language for these respondents.

percentages = combined "4" and "5" responses.) The Japanese aerospace engineers and scientists spent an average of 15.89 hours per week communicating technical information to others; U.S. aerospace engineers and scientists spent an average of 16.98 hours per week. Japanese aerospace engineers and scientists spent an average of 10.07 hours per week, and U.S. aerospace engineers and scientists spent an average of 13.97 hours per week working with communications received from others (table 3).

Table 3. Mean (Median) Number of Hours Spent Each Week By Japanese and U.S. Aerospace Engineers and Scientists Communicating Technical Information

| Communication Activity | Japan | U.S. |
|---|-----------------------------|-----------------------------|
| Communication With Others | 15.89 (14.00) hours/week | 16.98 (15.00) hours/week |
| Working with Communications Received From Others | 10.07 (10.00) hours/week | 13.97 (12.00) hours/week |

Approximately 60% of the Japanese respondents and 70% of the U.S. respondents indicated that the amount of time they spent communicating technical information had increased over the past 5 years (table 4). Twenty-five percent of the Japanese respondents and 24% of the U.S. respondents indicated that the amount of time they spent communicating technical information had stayed the same over the past 5 years. Only 15% of the Japanese respondents and 6% of the U.S. respondents indicated that the amount of time they spent communicating technical information had decreased over the past 5 years.

Table 4. Changes in the Past 5 Years in the Amount of Time Spent Communicating Technical Information by Japan and U.S. Aerospace Engineers and Scientists

| | Ja | npan | τ | J.S. |
|-------------------------------------|----------------|----------------------|---------------|-----------------------|
| Change | % | (n) | % | (n) |
| Increased Stayed The Same Decreased | 60 25 15 | (56) (24) (14) | 70 24 6 | (239) (80) (21) |

As they have advanced professionally, 35% of the Japanese respondents have increased the amount of time they spend communicating technical information. Conversely, 65% of the U.S. respondents indicated that, as they have advanced professionally, they have increased the amount of time they spend communicating technical information (table 5).

Table 5. Changes in the Amount of Time Spent Communicating Technical Information as a Part of Professional Advancement by Japanese and U.S. Aerospace Engineers and Scientists

| | Ja | npan | ι | J.S. |
|-------------------------------------|----------------|----------------------|---------------|-----------------------|
| Change | % | (n) | % | (n) |
| Increased Stayed The Same Decreased | 35 34 31 | (33) (32) (29) | 65 26 9 | (221) (87) (32) |

The Production and Use of Technical Communications

The process of collaborative writing was examined as part of this study. Survey participants were asked whether they wrote alone or as part of a group (table 6). Approximately 21% of the Japanese respondents and 15% of the U.S. respondents write alone. Although a higher percentage of the U.S. respondents than the Japanese respondents writes with a group of

2 to 5 people or with a group of 5 or more people, writing appears to be a collaborative process for both groups.

Table 6. Collaborative Writing Practices of Japanese and U.S.

Aerospace Engineers and Scientists

| | | Japan | | U.S. | | |
|---|--------------|----------|--------------|--------------|----------|---------------|
| Collaborative Practices | X % | %* | (n) | X % | %* | (n) |
| I Write Alone I Write With One Other Person I Write With A Group Of Two | 70.1 12.8 | 21 57 | (20) (54) | 61.1 20.7 | 15 72 | (50) (246) |
| To Five People I Write With A Group Five Or | 14.9 | 53 | (50) | 15.6 | 61 | (208) |
| More People | 2.2 | 11 | (10) | 2.1 | 14 | (47) |

^{*} Percentages do not total 100

Japanese and U.S. aerospace engineers and scientists were asked to assess the influence of group participation on writing productivity (table 7). Only 35% of the Japanese respondents and 32% of the U.S. respondents indicated that group writing is more productive than writing alone. Eighteen percent of the Japanese respondents and 32% of the U.S. respondents found that group writing is about as productive as writing alone, and 26% of the Japanese respondents and 20% of the U.S. respondents found that writing in a group is less productive than writing alone.

Table 7. Influence of Group Participation on Writing Productivity For Japanese and U.S. Aerospace Engineers and Scientists

| | Japan | | U.S. | |
|--|----------------------|------------------------------|----------------------|--------------------------------|
| Group Participation | % | (n) | % | (n) |
| A Group Is More Productive Than Writing Alone A Group Is About As Productive As Writing Alone A Group Is Less Productive Than Writing Alone I Only Write Alone | 35 18 26 21 | (33) (17) (24) (20) | 32 32 20 15 | (110) (107) (68) (50) |

Of the respondents who did not write alone, 48% of the Japanese group and 47% of the U.S. group worked with the same group when producing written technical communications (table 8). The average number of people in the Japanese group was $\overline{X} = 5.11$ and the average number of people in the U.S. group was $\overline{X} = 3.21$. Thirty-one percent of the Japanese respondents worked in an average (mean) number of 3.10 groups, each group containing an average of 3.14 people. Forty percent of the U.S. respondents worked in an average (mean) number of 2.82 groups, each group containing an average (mean) of 3.03 people.

Table 8. Production of Written Technical Communications as a Function of Number of Groups and Group Size For Japan and U.S. Aerospace Engineers and Scientists

| | Ja | Japan | | S. |
|--|--------------|--------------|--------------|----------------|
| Groups and Group Size | % | (n) | % | (n) |
| Worked With Same Group Yes No I Only Write Alone | 48 | (45) | 47 | (161) |
| | 31 | (29) | 38 | (129) |
| | 21 | (20) | 15 | (50) |
| Number of People in Group Mean Median | 5.11 | (45) | 3.21 | (161) |
| | 3.00 | (45) | 3.00 | (161) |
| Number of Groups Mean Median | 3.10 | (29) | 2.82 | (129) |
| | 3.00 | (29) | 3.00 | (129) |
| Number of People in Each Group Mean Median | 3.14 3.00 | (29) (29) | 3.03 3.00 | (129) (129) |

From a prepared list, both groups were asked to indicate the number of times they had prepared, either alone or as a member of a group, specific technical information products. As

individual authors, the Japanese respondents most frequently **prepared** letters, trade/promotional literature, technical proposals, drawings/specifications, and in-house technical reports (table 9). As part of a working group, these Japanese aerospace engineers and scientists most frequently **prepared** in-house technical reports, drawings/specifications, letters, technical proposals, and technical manuals. For these products, the mean number of persons per group ranged from a high of $\bar{X} = 7.00$ to a low of $\bar{X} = 2.20$.

^{**} Median cannot be calculated.

As individual authors, U.S. respondents most frequently prepared memoranda, letters, drawings/specifications, audio/visual materials, and technical talks/presentations (table 10). As

a group, U.S. aerospace engineers and scientists most frequently prepared audio/visual materials, letters, memoranda, drawings/specifications, and technical talks/presentations. For these products, the mean number of persons per group ranged from a high of $\bar{X} = 3.46$ to a low of $\bar{X} = 2.50$.

Letters, conference/meeting papers, trade/promotional literature, computer program documentation, and drawings/specifications were the technical information products most frequently used by these Japanese aerospace engineers and scientists (table 11). On the average, they used 22 letters, 18 conference/meeting papers, 15 computer program documentation, 15 trade/promotional literature, 14 drawings/specifications in a 6-month period. Audio/visual

material, technical talks/presentations, AGARD technical reports, abstracts, and U.S. government technical reports were the technical information products least frequently used by these Japanese aerospace engineers and scientists during a 6-month period.

Memoranda, letters, abstracts, journal articles, and conference/meeting papers were the technical information products most frequently used by U.S. aerospace engineers and scientists. On the average, they used 25 memoranda, 17 letters, 16 abstracts, 16 journal articles, and 15 drawings/specifications during a 6-month period. Agard, technical proposals, in-house technical reports, technical manuals, and U.S. government technical reports were the technical information products least frequently used by U.S. aerospace engineers and scientists during a 6-month period.

The types of technical information most frequently **produced** by the Japanese aerospace engineers and scientists included basic scientific and technical information, experimental techniques, product and performance characteristics, government rules and regulations, and computer programs (table 12). The types of technical information least frequently **produced** by these Japanese aerospace engineers and scientists included patents and inventions, in-house technical data, codes of standards and practices, economic information, and technical specifications. Basic scientific and technical information, product and performance characteristics, experimental techniques, computer programs, and government rules and regulations were the kinds of technical information most frequently **produced** by U.S. aerospace engineers and scientists. In-house technical data, codes of standards and practices, patents and inventions, economic information, and technical specifications were the kinds of technical information beast frequently **produced** by U.S. aerospace engineers and scientists.

Table 12. Types of Information Produced by Japanese and U.S. Aerospace Engineers and Scientists [n = 94; 340]

| Information Type | Japan % | U.S. % |
|--|------------|-----------|
| Basic Scientific And Technical Information | 70 | 92 |
| Experimental Techniques | 68 | 65 |

| Government Rules And Regulations | 57 | 45 |
| Economic Information | 37 | 25 |

The types of technical information most frequently used by the Japanese aerospace engineers and scientists included basic scientific and technical information, experimental techniques, computer programs, government rules and regulations, and product and performance characteristics (table 13). The types of technical information least frequently used by these Japanese aerospace engineers and scientists included patents and inventions, in-house technical data, codes of standards and practices, economic information, and technical specifications. Basic scientific and technical information, product and performance characteristics, computer programs, experimental techniques, and government rules and regulations were the types of technical information most frequently used by U.S. aerospace engineers and scientists. Economic information, patents and inventions, codes of standards and practices, in-house technical data, and technical specifications were the types of technical information least frequently used by the U.S. survey participants.

Content for an Undergraduate Course in Technical Communications

Japanese and U.S. survey participants were asked their opinions regarding an undergraduate course in technical communications for aerospace majors. Approximately 26% of the Japanese respondents and 71% of the U.S. respondents indicated that they had taken a course(s) in technical communications/writing. (Approximately 74% of the Japanese respondents and 29% of the U.S. respondents indicated they had not taken a course in technical communications/writing.) Approximately 2% of the Japanese participants had taken a course(s) as undergraduates, approximately 19% had taken a course(s) after graduation, and about 5% had taken a course(s) both as undergraduates and after graduation. Approximately 20% of the U.S. respondents had taken a course(s) as undergraduates, approximately 19% had taken a course(s) after graduation, and 32% had taken a course(s) both as undergraduates and after graduation. Of the 26% (24 respondents) of the Japanese engineers and scientists who had taken coursework in technical communications/writing, all of them (24 respondents) indicated that doing so had helped them to communicate technical information. Of the 71% (241 respondents) of the U.S. engineers and scientists who had taken a course(s) in technical communications/writing, about 69% (233 respondents) indicated that doing so had helped them to communicate technical information.

Japanese and U.S. participants were asked their opinion regarding the desirability of undergraduate aerospace majors taking a course in technical communications. Approximately 71% of the Japanese respondents and 96% of the U.S. participants indicated that aerospace majors should take such a course. Approximately 44% of the Japanese participants and about 90% of the U.S. participants indicated that the course should be taken for credit (table 14).

Table 14. Opinions Regarding an Undergraduate Course in Technical Communications for Aerospace Majors

| | Japan | | U | J.S. |
|--|----------|--------------|---------|---------------|
| Opinions | % | (n) | % | (n) |
| Taken For Credit Not Taken For Credit | 44 15 | (41) (14) | 90 4 | (259) (11) |
| Don't Know Should Not Have To Take Course In | 13 | (12) | 2 | (6) |
| Technical Communications | 28 | (27) | 4 | (11) |

The Japanese and U.S. participants were asked if undergraduate aerospace engineering and science majors should take a course in technical communications and, if so, how the course should be offered. About 71% (67 respondents) of the Japanese participants and 96% (276 respondents) of the U.S. participants indicated "yes," that students should take a course in technical communications. About 19% of the Japanese respondents indicated that the course should be taken as part of a "required" course, about 43% thought the course should be taken as part of an "elective" course, none thought it should be taken as a "separate" course, about 10% did not have an opinion, but only 29% of the Japanese respondents indicated that undergraduate aerospace engineering and science students should not have to take a course in technical communications/writing. About 82% of the U.S. respondents indicated that the course should be taken as part of a "required" course, about 12% thought the course should be taken as part of an "elective" course, none thought it should be taken as a "separate" course, about 2% did not have an opinion, but only 4% of the U.S. respondents indicated that undergraduate aerospace engineering and science students should not have to take a course in technical communications/writing. A simple majority of both the U.S. respondents (51%) indicated that

the technical communications/writing instruction should be taken as a separate course, while only 21% of the Japanese respondents indicated that the technical communications/writing instruction should be taken as a separate course.

Japanese and U.S. respondents were asked to select from similar lists appropriate principles for inclusion in an undergraduate technical communications course for aerospace engineering and science students. Table 15 shows their responses. Japanese respondents indicated that developing paragraphs, writing at sentence level, organizing information, defining the purpose of the communication, and word choice were more important assessing the reader's needs, note-taking and quoting, and editing and revising. U.S. respondents indicated that organizing information, defining the purpose of the communication, assessing the reader's needs, editing and revising, and developing paragraphs were more important than note-taking and quoting, writing at sentence level, and word choice.

Table 15. Recommended Principles for an Undergraduate
Technical Communications Course for Aerospace Majors

|--|--|--|--|--|
| Principles | % | (n) | % | (n) |
| Defining The Communication's Purpose Assessing Reader's Needs Organizing Information Developing Paragraphs Writing Sentences Note Taking And Quoting Editing And Revising Choosing Words | 65 44 75 90 85 51 51 64 | (61) (41) (70) (84) (80) (48) (48) (60) | 91 87 97 87 72 44 87 83 | (310) (295) (329) (296) (245) (149) (295) (283) |

The Japanese and U.S. respondents also chose from a list of specific topics appropriate mechanics to be included in an undergraduate technical communications course for aerospace majors. Their responses appear in table 16. Both groups of respondents placed references, symbols, punctuation, and abbreviations in the top five list for inclusion, although not in the same order of appearance. Japanese respondents included acronyms to complete their top five list, and U.S. respondents included spelling to complete their list.

Table 16. Recommended Mechanics for an Undergraduate Technical Communications Course for Aerospace Majors

| | Ja | npan | U.S. | | |
|----------------|----|------|------|-------|--|
| Mechanics | % | (n) | % | (n) | |
| Abbreviations | 66 | (62) | 55 | (187) | |
| Acronyms | 64 | (60) | 52 | (176) | |
| Capitalization | 50 | (47) | 54 | (182) | |
| Numbers | 51 | (48) | 48 | (163) | |
| Punctuation | 53 | (50) | 74 | (251) | |
| References | 68 | (64) | 80 | (272) | |
| Spelling | 44 | (41) | 55 | (187) | |
| Symbols | 66 | (62) | 64 | (218) | |

Given a list of 13 items, the Japanese and U.S. respondents were next asked to select appropriate on-the-job communications to be included in an undergraduate technical communications course. Their responses appear in table 17. Both groups included oral technical presentations, use of information sources, conference/meeting papers, technical reports, conference/meeting papers among their top choices, although not in the same order of appearance. It is interesting to note that more similarities than differences exist among their

choices for the types of written communications that students should learn to produce. These choices may reflect information acquisition and use patterns among aerospace professionals.

Table 17. Recommended On-the-Job Communications To Be Taught in an Undergraduate Technical Communications Course for Aerospace Majors

| | Ja | pan | U | .S. |
|--|----|------|----|-------|
| On-the-Job Communications | % | (n) | % | (n) |
| Abstracts Letters Memoranda Technical Instructions Journal Articles Conference/Meeting Papers Literature Reviews Technical Manuals Newsletter/Newspaper Articles Oral Technical Presentations Technical Specifications | 48 | (45) | 85 | (289) |
| | 27 | (25) | 61 | (208) |
| | 25 | (23) | 60 | (204) |
| | 59 | (55) | 62 | (212) |
| | 48 | (48) | 64 | (217) |
| | 78 | (73) | 67 | (228) |
| | 21 | (20) | 50 | (169) |
| | 56 | (53) | 43 | (147) |
| | 9 | (8) | 15 | (50) |
| | 72 | (68) | 92 | (311) |
| | 60 | (56) | 45 | (152) |
| Technical Reports Use Of Information Sources | 70 | (66) | 81 | (274) |
| | 60 | (56) | 72 | (244) |

In an attempt to validate the findings, the top 10 on-the-job communications were paired with the top five (on average) communications "produced" and "used" by the respondents (table 18). The on-the-job communications recommended by the Japanese respondents do not appear to closely reflect the types of communications they produce and use, nor do the responses of the U.S. participants appear to reflect the types of communications they produce and use. It is interesting to note that although neither group places technical reports in the top five category of communications produced or used, both groups recommended that technical report writing be taught.

^{*} indicates a tie

Use of Libraries and Technical Information Centers

Almost all of the respondents indicated that their organization has a library or technical information center. Unlike the U.S. respondents (9%), about 43% of the Japanese respondents indicated that the library or technical information center was located in the building where they

worked. About 55% of the Japanese and 88% of the U.S. respondents indicated that the library or technical information center was outside the building in which they worked but was located nearby. For 52% of the Japanese group, the library or technical information center was located 1 kilometer or less from where they worked. For about 81% of the U.S. respondents, the library or technical information center was located 1.0 mile or less from where they worked.

Respondents were asked to indicate the number of times they had visited their organization's library or technical information center in the past 6 months (table 19). Overall, the Japanese respondents used their organization's library or technical information center more than their U.S. counterparts did. The average use rate for Japanese respondents was $\bar{X} = 20.9$ during the past 6 months compared to $\bar{X} = 9.2$ for the U.S. respondents. The median 6-month use rates for the two groups were 10.0 and 4.0, respectively.

Table 19. Use of the Organization's Library in Past 6 Months by Japanese and U.S. Aerospace Engineers and Scientists

| | Ja | pan | U.S. | |

| Mean Median | | 0.9* 0.0 | 1 | .2* .0 |

^{*} $p \le .05$.

Respondents were also asked to rate the importance of their organization's library or technical information center (table 20). Importance was measured on a 5-point scale with 1 = not at all important and 5 = very important. A majority of both groups indicated that their organization's library or technical information center was important to performing their present professional duties. About 73% of the Japanese aerospace engineers and scientists indicated that their organization's library or technical information center was important or very important to performing their present professional duties. About 44% of the U.S. aerospace engineers and scientists indicated that their organization's library or technical information center was important or very important to performing their present professional duties. Approximately 7% of the Japanese respondents and approximately 13% of the U.S. respondents indicated that their organization's library or technical information center was very unimportant to performing their present professional duties.

Table 20. Importance of the Organization's Library to Japanese and U.S. Aerospace Engineers and Scientists

| | Japan | | U.S. | |
|---|----------------------------|----------------------------|-----------------------------|-------------------------------|
| Importance | % | (n) | % | (n) |
| Very Important Neither Important Nor Unimportant Very Unimportant Do Not Have A Library | 73.4 17.0 7.4 2.1 | (45) (40) (7) (2) | 44.4 68.2 12.9 3.2 | (232) (53) (44) (11) |

From a list of information sources, survey participants were asked to indicate which ones they routinely used in problem solving (table 21). In addition to personal knowledge, upon which they rely greatly, the U.S. aerospace engineers and scientists in this study display information-seeking behavior patterns similar to those of U.S. engineers in general.

Table 21. Information Sources Used by Japanese and U.S. Aerospace Engineers and Scientists in Problem Solving [n = 94; 340]

| | Japan | | U.S. | |
|--|-------|------|------|-------|
| Source | % | (n) | % | (n) |
| Personal Store Of Technical Information | 97 | (91) | 99 | (337) |
| Spoke With A Coworker Or People Inside My Organization | 94 | (88) | 99 | (338) |
| Spoke With A Colleague Outside Of My Organization | 81 | (76) | 94 | (318) |
| Used Literature Resources Found In My Organization's Library | 72 | (68) | 91 | (310) |
| Spoke With A Librarian Or Technical Information Specialist | 50 | (47) | 81 | (274) |

The information-seeking behavior of the Japanese respondents did not vary greatly from that of their American counterparts. U.S. participants used their personal stores of technical information, coworkers in the organization, colleagues outside the organization, a librarian or technical information specialist, and literature resources found in the organization's library. Their Japanese counterparts used their personal stores of technical information, coworkers in the organization, colleagues outside the organization, literature resources found in the organization's library, and a librarian or technical information specialist.

Use and Importance of Computer and Information Technology

Survey participants were asked if they use computer technology to prepare technical information. Ninety-five percent of the Japanese and 99% of the U.S. respondents use computer technology to prepare technical information. About 35% of the Japanese respondents and about 73% of the U.S. respondents "always" use computer technology to prepare technical information. A majority of both groups (87% and 97%) indicated that computer technology had increased their

ability to communicate technical information. About 59% of the Japanese respondents and 80% of the U.S. respondents stated that computer technology had increased their ability to communicate technical information "a lot".

From a prepared list, survey respondents were asked to indicate which computer software they used to prepare written technical information (table 22). Word processing software was used most frequently by both groups. With the exception of business graphics, the U.S. respondents made slightly greater use of computer software for preparing written technical communications than did their Japanese counterparts.

Table 22. Use of Computer Software by Japanese and U.S. Aerospace Engineers and Scientists to Prepare Written Technical Communications

| | Japa | U.S. | | |
|----------------------------|------|------|----|-------|
| Software | % | (n) | % | (n) |
| Word Processing | 94 | (88) | 96 | (327) |
| Outliners And Prompters | 12 | (11) | 14 | (46) |
| Grammar And Style Checkers | 23 | (22) | 30 | (103) |
| Spelling Checkers | 67 | (63) | 88 | (299) |
| Thesaurus | 14 | (13) | 37 | (127) |
| Business Graphics | 32 | (30) | 15 | (52) |
| Scientific Graphics | 49 | (46) | 91 | (308) |
| Desktop Publishing | 25 | (23) | 48 | (162) |

Survey respondents were also given a list of information technologies and asked, "How do you view your use of the following information technologies in communicating technical information?" Their choices included "already use it"; don't use it, but may in the future"; and "don't use it and doubt if I will". (See table 23.)

The Japanese and U.S. aerospace engineers and scientists in this study use a variety of information technologies. The percentages of "I already use it" responses ranged from a high

of 92% (FAX or TELEX) to a low of 1% (teleconferencing) for the Japanese respondents. Similarly, the U.S. responses ranged from a high of 91% (FAX or TELEX) to a low of 13% (audio tapes and cassettes).

Table 23. Use, Nonuse, and Potential Use of Information Technologies by Japanese and U.S. Aerospace Engineers and Scientists

Use and Importance of Electronic Networks

Survey participants were asked if they use electronic networks at their workplace in performing their present duties. Approximately 55% of the Japanese respondents use electronic

Table 24. Use of Electronic Networks by Japanese and U.S. Aerospace Engineers and Scientists

| Percentage of a 40-hour Work Week | Ja | npan | U.S. | | |
|--|-----------------------------|---|------------------------------|---|--|

^{*} $p \le .05$.

networks and about 45% either do not use (30%) or do not have access to (15%) electronic networks (table 24). About 89% of the U.S. respondents use electronic networks in performing their present duties and about 12% either do not use (9%) or do not have access to (3%) electronic networks.

Respondents were also asked to rate the importance of electronic networks in performing their present duties (table 25). Importance was measured on a 5-point scale with 1 = not at all

Table 25. Importance of Electronic Networks to Japanese and U.S. Aerospace Engineers and Scientists

| | Ja | pan | U.S. | | |
|--|-----------------------------|-----------------------------|---------------------|-------------------------------|--|
| Importance | % | (n) | % | (n) | |
| Very Important Neither Important Nor Unimportant Very Unimportant Do Not Use Or Have Access To Electronic Networks | 34.1 18.1 3.2 44.7 | (32) (17) (3) (42) | 65.0 11.2 7.6 | (221) (38) (43) (38) | |
| Mean | 3.8 | | 4 | .1 | |

important and 5 = very important. The U.S. respondents rated electronic networks almost two times as important as their Japanese counterparts did. More Japanese (18.1%) than U.S. respondents (11.2%) indicated that electronic networks were neither important nor unimportant. Respondents were asked how they accessed electronic networks (table 26): mainframe terminal, personal computers, and workstations. Access via personal computer was most frequently reported.

Respondents using them were asked to indicate the purpose(s) for which they used electronic networks (table 27). Although not in the same order, both the Japanese and U.S. respondents indicated that electronic file transfer, electronic mail, remote log in for

design/computational tools, and connecting to geographically distant sites represented their greatest use of electronic networks. Also noticeable for both groups is the lack of electronic network use for accessing and searching library catalogs, acquiring (ordering) documents from the library, and searching (bibliographic) data bases.

| Prepare Scientific And Papers With | | ` / | | () |
| Colleagues At Geographically Distant Sites | 11.7 | (11) | 32.9 | (112) |

Survey participants who used electronic networks were asked to identify the groups with whom they exchanged messages or files (table 28). The Japanese respondents did not display a consistent pattern of message and file exchange both within and outside of their organization. Overall, the U.S. group exhibited higher percentages of network use for exchanging messages or files than did their Japanese counterparts. The U.S. respondents displayed a fairly consistent pattern of use as did the Japanese respondents.

Table 28. Use of Electronic Networks by Japanese and U.S. Aerospace Engineers and Scientists to Exchange Messages or Files

| | Japan | | U.S. | |
|--|--------------|--------------|--------------|----------------|
| Exchange With | % | (n) | % | (n) |
| Members Of Own Work Group | 31.9 | (30) | 81.5 | (277) |
| Others In Your Organization But Not In Your Work Group | 20.2 | (19) | 77.9 | (265) |
| Others In Your Organization, Not In Your Work Group, At Geographically Distant Site People Outside Your Organization | 17.0 25.5 | (16) (24) | 56.8 58.8 | (193) (200) |
| Do Not Use Or Have Access To Electronic Networks | 44.7 | (42) | 11.2 | (38) |

Survey participants were asked about the likelihood of their using electronically formatted information that has traditionally appeared as paper products (table 29). With minor exception, both groups are more likely to use online systems (with full text and graphics) for technical papers and CD-ROM systems (with full text and graphics) for technical papers than they are to use computer program listings or data tables/mathematical presentations. When asked why they would not use these information products in electronic format, the survey respondents gave the following reasons: (1) 25% of the Japanese and 28% of the U.S. group prefer print (paper) formats; (2) 21% of the Japanese and 34% of the U.S. group cited hardware or software

incompatibility; and (3) 22% of the Japanese and 14% of the U.S. group indicated that lack of computer access was the reason for non-use.

Table 29. Attitudes Toward the Use of Information in Specified Formats by Japanese and U.S. Aerospace Engineers and Scientists

^a Likely use was measured on a 1 to 5 point scale with "1" being very unlikely and

Use of Foreign and Domestically Produced Technical Reports

To better understand the transborder migration of scientific and technical information (STI) via the technical report, survey participants were asked about their use of foreign and domestically produced technical reports (table 30) and the importance of these reports in performing their professional duties (table 31). Both groups make the greatest use of their own technical reports (87% of the Japanese respondents use NAL reports and 97% of the U.S. group use NASA technical reports). In addition to their own reports, the Japanese respondents use NASA (89%); AGARD (60%); German DFVLR, DLR, and MBB (53%); and British ARC and RAE (48%) technical reports.

In addition to their own reports, the U.S. group uses AGARD (82%) and British ARC and RAE (54%) technical reports. Neither group makes great use of Indian NAL, Dutch NLR, ESA,

[&]quot;5" being very likely. Percentages include combined "4" and "5" responses.

| U.S. NASA | 89.4 | (84) | 96.5 | (277) |

or Russian TsAGI technical reports. Survey participants were also asked about their access to these technical reports series. Overall, the U.S. group appears to have better access to foreign technical reports than do their Japanese counterparts. Both groups have about equal access to NASA technical reports.

Technical report importance was measured on a 5-point scale with 1 = very unimportant and 5 = very important. Both groups were asked to rate the importance of selected foreign and domestic technical reports in performing their present professional duties. The average (mean) importance ratings are shown in table 31. The Japanese respondents rated the importance of U.S. NASA reports ($\bar{X} = 4.46$) followed by AGARD ($\bar{X} = 3.67$), and German DFVLR, DLR, and MBB reports ($\bar{X} = 3.15$). The U.S. group rated NASA reports most important ($\bar{X} = 4.26$) followed by AGARD ($\bar{X} = 3.42$) and British ARC and RAE reports ($\bar{X} = 2.89$).

Table 31. Importance of Foreign and Domestically Produced Technical Reports to Japanese and U.S. Aerospace Engineers and Scientists

| | Japan | | U.S. | | |
|---|---|--|---|--|--|
| Country/Organization | Rating ^a X | (n) | Rating ^a \overline{X} | (n) | |
| AGARD British ARC And RAE ESA Indian NAL French ONERA German DFVLR, DLR, And MBB Japanese NAL Russian TsAGI Dutch NLR U.S. NASA | 3.67 3.12 2.78* 2.02* 2.97* 3.15* 3.94* 2.23* 2.65* 4.46 | (85) (85) (79) (52) (79) (84) (93) (43) (60) (92) | 3.42 2.89 1.44* 1.40* 2.25* 2.20* 1.63* 1.60* 1.81* 4.26 | (282) (266) (242) (241) (257) (247) (239) (231) (246) (285) | |

^a 1 to 5 point scale was used to measure importance with "1" being the lowest possible importance and "5" being the highest possible importance. Hence, the higher the average (mean) the greater the importance of the report series.

DISCUSSION

Given the limited purposes of this exploratory study, the overall response rates, and the research designs, no claims are made regarding the extent to which the attributes of the respondents in the studies accurately reflect the attributes of the populations being studied. A much more rigorous research design and methodology would be needed before any claims could be made. Nevertheless, the findings of the studies do permit the formulation of the following general statements regarding the technical communications practices of the aerospace engineers and scientists who participated in the two studies:

^{*} $p \le .05$.

- 1. The ability to communicate technical information effectively is important to Japanese and U.S. aerospace scientists and engineers.
- 2. As the Japanese and U.S. aerospace engineers and scientists in these studies have advanced professionally, the amount of time they spend producing and working with technical communications has increased for over one-third (35%) of the Japanese respondents and slightly less than two-thirds (65%) of the U.S. respondents.
- 3. The Japanese and U.S. aerospace engineers and scientists in these studies write more frequently in small groups than alone. The Japanese respondents find collaborative writing about as productive as individual writing, while the U.S. respondents find collaborative writing more productive than writing alone. Both groups of respondents frequently produce about the same types of materials whether they write as members of a group or as individuals.
- 4. Approximately 26% of the Japanese and 71% of the U.S. aerospace engineers and scientists in these studies had taken a course in technical communications. All of the Japanese and about 71% of the U.S. respondents indicated that such a course had helped them communicate technical information.
- 5. Although the percentages vary for each item, there was considerable agreement among the Japanese and U.S. aerospace engineers and scientists in these studies regarding the on-the-job communications to be included in an undergraduate technical communications course for aerospace and science students. There was also considerable agreement on the appropriate principles and mechanics that should be included in such a course.
- 6. The Japanese and U.S. aerospace engineers and scientists in these studies make use of personal knowledge, discussions with colleagues within their organization, and discussions with colleagues outside their organization for solving technical problems. The U.S. group, much more than the Japanese group, places greater reliance on librarians or technical information specialists for ascertaining information used in problem solving.
- 7. Although important to both Japanese and U.S. aerospace engineers and scientists, libraries and technical information centers were used much more by and were more important to Japanese respondents. More Japanese aerospace engineers and scientists had a library or technical information center located in their building than did their U.S. counterparts.
- 8. Both groups made considerable use of computer technology to prepare technical information. About 87% of the Japanese respondents, and 97% of the U.S. respondents indicated that computer technology had increased their ability to communicate technical information.
- 9. With the exception of business graphics, U.S. aerospace engineers and scientists made somewhat greater use of computer software than did their Japanese counterparts.

- 10. There were notable similarities between the two groups in terms of the information technologies presently being used and those that might be used in the future.
- 11. U.S. aerospace engineers and scientists made greater use of electronic networks than did their Japanese counterparts and rated the use of electronic networks almost twice as important as their Japanese counterparts rated electronic network use. Both groups reported similar use of electronic networks. U.S. aerospace engineers and scientists made greater use of electronic networks to access/search the library's catalog, read electronic (bibliographic) data bases, and retrieve information than did their Japanese counterparts.
- 12. U.S. and Japanese respondents make the greatest use of NASA technical reports and rank them highest in terms of importance in performing their professional duties. Both groups make extensive use of (and consider important) AGARD technical reports.
- 13. Apart from English, both groups reported limited fluency (reading and speaking) in French, Dutch, German, and Russian.

CONCLUDING REMARKS

Despite the limitations of this investigation, these findings contribute to our knowledge and understanding of the technical communications practices among aerospace engineers and scientists at the national and international levels. The findings reinforce some of the conventional wisdom regarding the nature and importance of technical communications and the amount of time that engineers and scientists devote to communicating technical information and raise questions about their use of information sources and resources, particularly in light of current technologies. The results of this study should prove useful to R&D managers, library and information science professionals, curriculum developers, and technical communicators.

ACKNOWLEDGMENTS

The authors express their thanks to Dr. Robert A. Kilgore for his support of this research. The authors also express their thanks to the Japanese and U.S. aerospace engineers and scientists for their participation.

APPENDIX A

NASA/DoD AEROSPACE KNOWLEDGE DIFFUSION RESEARCH PROJECT

Fact Sheet

The process of producing, transferring, and using scientific and technical information (STI), which is an essential part of aerospace research and development (R&D), can be defined as Aerospace Knowledge Diffusion. Studies tell us that timely access to STI can increase productivity and innovation and help aerospace engineers and scientists maintain and improve their professional skills. These same studies indicate, however, that we know little about aerospace knowledge diffusion or about how aerospace engineers and scientists find and use STI. To learn more about this process, we have organized a research project to study knowledge diffusion. Sponsored by NASA and the Department of Defense (DoD), the NASA/DoD Aerospace Knowledge Diffusion Research Project is being conducted by researchers at the NASA Langley Research Center, the Indiana University Center for Survey Research, and Rensselaer Polytechnic Institute. This research is endorsed by several aerospace professional societies including the AIAA, RAeS, and DGLR and has been sanctioned by the AGARD and AIAA Technical Information Panels.

This 4-phase project is providing descriptive and analytical data about the flow of STI at the individual, organizational, national, and international levels. It is examining both the channels used to communicate STI and the social system of the aerospace knowledge diffusion process. Phase 1 investigates the information-seeking habits and practices of U.S. aerospace engineers and scientists, in particular their use of government-funded aerospace STI. Phase 2 examines the industry-government interface and emphasizes the role of the information intermediary in the knowledge diffusion process. Phase 3 concerns the academic-government interface and emphasizes the information intermediary-faculty-student interface. Phase 4 explores the information-seeking behaviors of non-U.S. aerospace engineers and scientists from Western European nations, India, Israel, Japan, and the former Soviet Union.

The results of this research project will help us to understand the flow of STI at the individual, organizational, national, and international levels. The findings can be used to identify and correct deficiencies; to improve access and use; to plan new aerospace STI systems: and should provide useful information to R&D managers, information managers, and others concerned with improving access to and utilization of STI. These results will contribute to increasing productivity and to improving and maintaining the professional competence of aerospace engineers and scientists. The results of our research are being shared freely with those who participate in the study.

| As part of Phase 4 of the NASA/DoD Aerospace Knowledge Diffusion Research Project, two studies were conducted that investigated the technical communications practices of Japanese and U.S. aerospace engineers and scientists. Both studies have the same seven objectives: first, to solicit the opinions of aerospace engineers and scientists regarding the importance of technical communications to their profession; second, to determine the use and production of technical communications by aerospace engineers and scientists; third, to seek their views about the appropriate content of an undergraduate course in technical communications; fourth, to determine engineers' and scientists' use of libraries, technical information centers, and on-line data bases; fifth, to determine the use and importance of computer and information technology to them; sixth, to determine their use of electronic networks; and seventh, to determine their use of foreign and domestically produced technical reports. A self-administered questionnaire was distributed to aerospace engineers and scientists in Japan and at the NASA Ames Research Center and the NASA Langley Research Center. The completion rates for the Japanese and U.S surveys were 85 and 61 percent, respectively. Responses of the Japanese and U.S. participants to selected questions are presented in this report. | | | | |
